Flexible Excel & Word Document Processing for SQL Reporting Services, SharePoint, or .NET Applications

OfficeWriter makes it easy for developers and analysts to deliver data-rich reports in Excel and Word from high-performance server applications with no loss of fidelity, without using Office on the server.

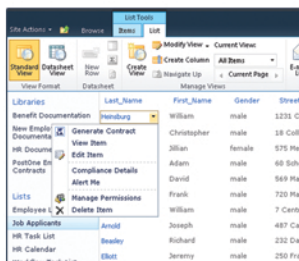

*OfficeWriter can work in combination with any of the above on your server.

OfficeWriter Document Processing API

- ✓ **Intuitive Object Model:** Generate, manipulate, and read Excel and Word documents with code in your own ASP.NET applications
- ✓ **Flexible:** Supports OpenXML XLSX and DOCX, as well as legacy XLS and DOC binary formats
- ✓ **Scalable:** Optimized for server-based performance and scalability, without automating Office on the server
- ✓ **Multiple Design Options:** Fully programmatic, or template-based design
- ✓ **Easy Data Import:** Import data into Excel and Word with minimal code

SharePoint List & Library Integration

With OfficeWriter and SharePoint you can create custom solutions for advanced document processing.

Including:

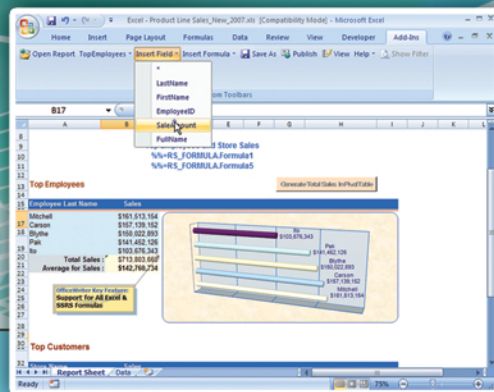

- ✓ **List Data Export:** Export list data to stylized Excel or Word templates
- ✓ **List Mail Merge:** Merge documents with SharePoint list data
- ✓ **Custom Document Processing:** Enable custom Office reporting in SharePoint features and applications

Enhance Excel and Word Reporting with OfficeWriter for SQL Server Reporting Services

OfficeWriter integrates with and extends Microsoft SQL Server Reporting Services by providing full-featured Excel and Word report rendering, including output in OpenXML XLSX and DOCX file formats. With OfficeWriter you can design, preview, and publish reports directly from Microsoft Excel and Word.

Full-Featured Excel and Word Report Rendering

- ✓ **Full-fidelity:** Use Reporting Services to export Excel spreadsheets and Word documents that support native Excel and Word features.
- ✓ **Fully utilize Excel features:** OfficeWriter lets you build reports with real Excel charts, pivot tables, formulas, and macros.
- ✓ **Template-based:** Merge data into existing Excel and Word templates, with your own corporate look and feel.
- ✓ **New file formats supported:** XLSX/XLSM, DOCX/DOCM, as well as legacy XLS and DOC in 2003, 2007, 2010, 2013, and 2016.

Design Reports in Excel and Word

- ✓ **Office-based report design:** The OfficeWriter Designer is an Office plug-in toolbar that lets you design SSRS reports using Excel and Word as the design tool.
- ✓ **Easy to use:** Business users can leverage their existing knowledge of Excel and Word to build reports, without learning a new report authoring tool.
- ✓ **WYSIWYG:** Because the Excel or Word file is the report definition, rendered output will look exactly the same as the template document.

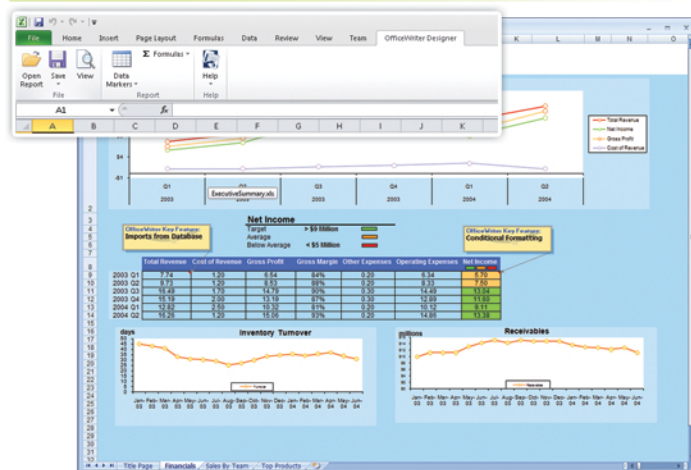

“I upgraded to latest version, with little effort. After that, users who were waiting around 30 minutes to obtain their Excel sheets, started getting results after ... say ...4 minutes (it is a heavy spreadsheet).”

By now the new version has been promoted to Production and everyone is happy.”
